

Contraception doesn't have to be about remembering to take the pill every day.

Here are several other options worthy of a closer look:

IMPLANT

Implant

- A small flexible rod (about the size of a hairgrip) that is placed just under your skin in your arm
- Lasts for up to 3 years
- A small needle is used to give you a local anaesthetic which will numb the skin. The implant is then inserted into the numbed part of your arm so you shouldn't feel any pain, just a bit of movement under your skin. This whole process takes just a few minutes.

COIL

Copper or Hormonal Coil

- A copper coil works straight away and lasts for 5-10 years, whilst a hormonal coil works for up to 3-5 years
- A small copper or plastic T shaped device which sits in the uterus (your womb)
- A small procedure is needed to fit this device which usually takes about 15 minutes. You may experience a little discomfort when it is fitted, similar to period pain, but it will only last for a short time.

INJECTION

Injection

- A single injection usually given in your buttock which takes just a few seconds
- Lasts for 13 weeks, so you will need to get the injection repeated every 13 weeks.

Benefits

Easy to fit

If you have the coil or injection, no-one knows that you've got it. The implant is always discreetly fitted

Long lasting

So that's one less thing to think about!

Some actually help with hormonal issues such as heavy periods by lightening the flow.

Over 99% effective in preventing pregnancy

Just fit and forget!

Will I gain weight?

There is no evidence to suggest that you will gain weight with a coil or implant. Some people may experience weight gain with the injection. This is associated more with young people who are already overweight.

It is quite normal for young people to gain weight and see changes to the shape of their body from puberty up into their late teens. People can often think that contraception has caused this when the weight gain is normal for them.

Are there side effects?

Mood changes **Change to periods** **Spots / acne changes**

Some people don't experience any side effects. So if your friend does, it doesn't mean you will also.

Some people experience some side effects such as mood changes, irregular bleeding and changes to your skin. These are most common in the first three months as your body is getting used to the new hormone.

This usually settles on its own, so it's worth sticking with it.

Will it hurt?

Everyone is different. A small needle prick for giving the injection or a local anaesthetic can sting, but it's only for a few seconds.

You may experience a little discomfort when a coil is fitted, similar to period pain - but it will only last for a short time.
